The development of electro-conductivity in systems that consists of non-conductive components is connected with a reciprocal acid-basic effect. As a result of the latter complex, saline compounds develop. On the occasion of the mixing of halides of quadrivalent tin and trivalent antimony with monocarbon acids of the aliphatic series and with their composed ethers electrolyres according to a general formula develop: $\text{SnX}_4 \cdot 3\text{RCOOR}'$, $\text{SnX}_4 \cdot 4\text{RCOOR}'$, $\text{SbX}_3\text{RCOOR}'$, $2\text{SbX}_3\text{RCOOR}'$, where R' denotes hydrogen or an aliphatic radical, and X denotes Cl or Br. The way of the electrolytic dissociation is shown in 4 reaction formulae (1-4) or equations respectively. From the equations 1. and 2. it becomes manifest that in the compounds $\text{SnX}_4 \cdot 3\text{RCOOR}'$ and $\text{SnX}_4 \cdot 4\text{RCOOR}'$ the organic molecule is a component of the cation and of the anion, whereas the halide of the quadrivalent tin only appears in the cation (equation 3 and 4). For the purpose of examining the schemes of the electrolytic dissociation tin chloride was investigated in methanol, acetic

acid and ethyl acetate, where the organic compound contained the isotope C¹⁴. In each case SnCl₄ was carried to the anode as well as to the cathode. This harmonizes with the equations 1 and 2. While this paper was being written, two essays were published (Miskidzh'van; Kuz'mina and Vol'nov) in which the authors suggest own schemes of the electrolytic dissociation of complex compounds. These schemes have in common that the formation of complex compounds is meant to represent an incorporating reaction, i.e. the molecule of the organic matter is to be a component of the complex cation. The experiments of the authors of the present paper contradict these schemes. For only the complex compounds of the 3-halides of antimony (and arsenic) with organic oxygen containing substance are incorporation products. The compounds of the same organic substances with the 4-halides of tin are not incorporation products. In the case of electrolysis according to the equation 3 the authors of the present paper have added methyl-red in addition to the acid marked with C¹⁴. As expected, the pigment moved into the same direction as the acetic acid, that is towards the cathode.

TITLE: On the Deviations From Raoult's Law Due to the Chemical Interaction Between the Components (Ob "otstupleniyakh" ot zakona Raulya, vyzyvayemykh khimicheskim vzaimodeystviem mezhdu komponentami)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 120, Nr 6, pp 1304 - 1306 (USSR)

ABSTRACT: The deviations from Raoult's law are generally explained by the fact that the forces of the cross-wise interaction (perekrestnoye vzaimodeystviye) between the molecules of the components differ from the arithmetic mean of the forces of the intermolecular interaction in each of the individual components. This apparently convincing explanation is insufficient and doubtful. The substance produced by the chemical interaction can exhibit a greater volatility than the components, if only in rare cases. In this case a positive deviation from Raoult's law occurs in spite of the chemical interaction and even a positive azeotropic substance can be produced. Secondly the chemical interaction can lead to positive deviations (partial vapor pressures) from Raoult's law and this may also occur if non-volatile products

Card 1/3

On the Deviations From Raoult's Law Due to the
Chemical Interaction Between the Components

SOV/20-120-6-39/59

are formed. If the reaction $mA + nB \rightleftharpoons A_m B_n$ (where $A_m B_n$ denotes a non-volatile substance) proceeds in a system composed of two non-associated components, a positive deviation from Raoult's law is possible at $m=n=1$. If, however, only one of the stoichiometrical coefficients differs from unity a positive deviation of at least one partial vapor pressure must occur. The basic considerations leading to this result are discussed. The positive deviation of vapor pressure is due to the chemical interaction and not to some other causes. The inversion of the sign of the deviations from the additive value is uniquely determined by the stoichiometrical coefficients of the reaction equation $mA + nB \rightleftharpoons A_m B_n$ and is independent from the thoroughness of the chemical interaction. The considerations discussed, of course, are only valid for the chemical interactions of the components of one solution. There are 2 figures.

TITLE:

The Influence of Some Electrolytes on the Solubility of Benzoic Acid in Water (Vliyanie nekotorykh elektrolitov na rastvorimost' benzoynoy kisloty v vode)

PERIODICAL:

Zhurnal obshchey khimii, 1959, Vol 29, Nr 4, pp 1393 - 1397
(USSR)

ABSTRACT:

The solubility of benzoic acid was the object of the investigation of some research workers (Refs 1-5). The data on their solubility in aqueous solutions of sodium- and lithium chloride, potassium-, tetramethyl ammonium-, tetraethyl ammonium-, and ethyl pyridinium iodide are given here. Sodium- and lithium chlorides as well as potassium iodide reduce the solubility of benzoic acid in water, tetramethyl ammonium, tetraethyl ammonium- and ethyl pyridinium iodide increase it. The solubility of the benzoic acid in tetraethyl ammonium iodide-, ethyl pyridinium iodide was investigated and it was found that these electrolytes are good solvents for this acid. An interpretation of the effect of "salting" in the case of this solution process is suggested. The solubility of the nonelectrolytes is in the case of an addition of the electrolytes in-

Card 1/2

The Influence of Some Electrolytes on the Solubility SOW/79-29-4-74/77
of Benzoic Acid in Water

creased if the electrolyte to be added is a better solvent than water for the nonelectrolyte concerned. The solubility of benzoic acid in ethyl alcohol and in the alcohol solution of the ethyl pyridinium iodide was investigated. Ethyl pyridinium iodide reduces the solubility of the benzoic acid in alcohol. The effect of the "salting out" is equally interpreted as that of "salting". The tables illustrate in numbers, the figure by means of curves the solubility of benzoic acid in water and in the given compounds. There are 1 figure, 4 tables, and 13 references, 1 of which is Soviet.

TITLE: Vapor Pressure of Systems Formed From Stannic Chloride With Esters (Davleniye para sistem, obrazuyemykh khlornym olovom so slozhnymi efirami)

PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, № 6, pp 1771-1781 (USSR)

ABSTRACT: On the investigation of the vapor pressure of the system $\text{SnCl}_4 - \text{C}_6\text{H}_5\text{OH}$ a positive deviation from Raoult's law was found when a chemical reaction took place in the system (Ref 1). This fact which is rather strange at first sight was explained by the reduction of the number of molecules at the formation of the compound $\text{SnCl}_4 \cdot 4\text{C}_6\text{H}_5\text{OH}$. Since in systems formed from SnCl_4 and esters the reaction between the components yields the compounds $\text{SnCl}_4 \cdot 2\text{A}$ (Refs 2-8), the authors investigated the vapor pressure of these systems and assumed that this vapor pressure had to involve a positive deviation from Raoult's law as well as a complementary proof of the concepts regarding composition and

Card 1/3

Vapor Pressure of Systems Formed From Stannic Chloride With Esters

SOV/79-29-6-2/72

structure of the complex compounds of stannic chloride with esters (Refs 8-11). The report recently published by Yu. N. Vol'nov (Ref 12) on the vapor pressure of these three systems is used as basis of the present paper because there not only the general but also the partial pressure is determined; besides the present data are not in agreement with those obtained by Vol'nov. In systems formed from SnCl_4 and the esters HCOOC_4H_9 , $\text{CH}_3\text{COOC}_2\text{H}_5$, $\text{C}_2\text{H}_5\text{COOC}_2\text{H}_5$, $\text{CH}_3\text{COOC}_4\text{H}_9$, $\text{C}_2\text{H}_5\text{COOC}_4\text{H}_9$, and iso- $\text{CH}_3\text{COOC}_5\text{H}_{11}$ the partial vapor pressure of stannic chloride shows deviations with change of sign and the vapor tension of the esters negative deviations from the additive straight line. It can be concluded from the progress of the curves of the partial vapor pressure that the vapor pressure reflects the formation of compounds with more than two molecules of the ester per one molecule SnCl_4 . Tables and figures illustrate the results obtained. There are 3 figures, 13 tables, and 15 references, 13 of which are Soviet.

TITLE: Vapor Pressure of the Systems $\text{SnCl}_4\text{-CCl}_3\text{COOC}_2\text{H}_5$ and
 $\text{SnCl}_4\text{-C}_6\text{H}_5\text{OCH}_3$ (Davleniye para sistem $\text{SnCl}_4\text{-CCl}_3\text{COOC}_2\text{H}_5$
i $\text{SnCl}_4\text{-C}_6\text{H}_5\text{OCH}_3$)PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, Nr 6, pp 1781-1785
(USSR)ABSTRACT: In a previous paper (Ref 1) it was shown that in systems formed from stannic chloride and esters the partial vapor pressure of stannic chloride shows deviations with change of sign, and the partial pressure of the esters negative deviations from the additive straight line owing to the formation of the compounds $\text{SnCl}_4 \cdot 2\text{RCOOR}'$ and $\text{SnCl}_4 \cdot 3\text{RCOOR}'$ in these systems. In the present paper the investigation results of the vapor pressure of the systems $\text{SnCl}_4\text{-CCl}_3\text{COOC}_2\text{H}_5$ and $\text{SnCl}_4\text{-C}_6\text{H}_5\text{OCH}_3$ are given. These systems differ from those previously investigated (Ref 1) by the absence of the electric

Card 1/2

Vapor Pressure of the Systems $\text{SnCl}_4\text{-CCl}_3\text{COOC}_2\text{H}_5$
and $\text{SnCl}_4\text{-C}_6\text{H}_5\text{OCH}_3$

SOV/79-29-6-3/72

conductivity since in them the complex formation stops in the stage of formation of the compounds having the composition 1 : 2 (Refs 2,3). It was therefore to be expected that this difference would also appear in the diagrams of the vapor pressure. The total and the partial vapor pressures of the systems $\text{SnCl}_4\text{-C}_6\text{H}_5\text{OCH}_3$ and $\text{SnCl}_4\text{-CCl}_3\text{COOC}_2\text{H}_5$ were investigated and the evaporation heats of these systems determined. The results obtained confirm the presence of the compounds $\text{SnCl}_4 \cdot 2\text{C}_6\text{H}_5\text{OCH}_3$ and $\text{SnCl}_4 \cdot 2\text{CCl}_3\text{COOC}_2\text{H}_5$ which seem to have a noticeable vapor pressure. Vapor pressures and evaporation heats are given in the figures and tables. There are 2 figures, 4 tables, and 4 Soviet references.

TITLE: "Deviations" From Raoult's Law

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 128, Nr 3, pp 561-563
(USSR)

ABSTRACT: The present paper is intended to analyze a further cause of the said "deviations" of vapor tension from Raoult's law. Previously (Ref 1) the author discussed such deviations in a binary system, the components of which chemically react with each other. Besides, it is attempted to show in what way the same causes influence the melting diagrams and the cryoscopic determination of the molecular weight. The author presupposes that one of the components of the binary system is dimeric, and the system follows Raoult's law. Besides, it must be assumed that - in the construction of the diagram of the dependence of vapor tension of the system on its composition - the formula-true molecular weight of component A is used for the calculation of its molar fraction, i.e. the calculation is carried out for the monomer. In this case, the diagram has the shape shown in figure 1. "Deviations" from Raoult's law can be seen although in fact there are no deviations whatsoever. The vapor tensions (partial and total) are not represented by additive lines only because a wrong mole-

Card 1/3

"Deviations" From Raoult's Law

30V/2o-128-3-35/58

cular weight of component A was taken for the calculation. In building up the above diagram, the author assumes that the dimer involved does not decompose by dilution with an indifferent component, B. If this condition is not fulfilled, and if the constant of dissociation of dimeric molecules to simple molecules is small, the diagram is only distinguished by the fact that all curves of vapor tension will touch the additive lines near coordinate B. Besides, the author discusses the shape of the melting diagrams with and without chemical interaction, in the latter case with an associating component. Considering the change in molar fractions, the author built up liquidus curves of substance A at different interrelations with the 2nd component B. Curve I (Fig 2) represents the "ideal" solubility of A (missing interaction $y = 0$). In the case of a formation of connection AB (on complete reaction), curve II originates; curve III corresponds to the formation of A_2B (T. N. Sumarokova found similar conditions in studying experimental data (Ref 2)). If AB_2 is formed, the molar fraction of A becomes larger due to the interaction as compared with the initial one. The crystallization temperatures lie then by $x \leq 1$ to $x = 0.5$ higher than the

Card 2/3

"Deviations" From Raoult's Law

SOV/2o-128-3-35/58

"ideal" curve I (Fig 3). If component B is associated (dimerized) and does not interact with A, curve III is formed (Fig 3). It intersects with curve I in the point $x = 0.5$. Here, curve I also intersects with curve II (Fig 4) which corresponds to connection A_2B_3 . This yields some practical conclusions with respect to cryoscopic measurements of the molecular weight. There are 4 figures and 2 Soviet references.

TITLE: On the Structure of the Complex Compound
 $\text{SnCl}_4 \cdot 2\text{CH}_3\text{COOH} \cdot 2\text{NH}_2\text{CH}_2\text{COOH}$

PERIODICAL: Zhurnal obshchey khimii, 1960, Vol. 30, No. 4, pp. 1334-1336

TEXT: The complex compound $\text{SnCl}_4 \cdot 2\text{NH}_2\text{CH}_2\text{COOH} \cdot 2\text{CH}_3\text{COOH}$ (Ref. 1) was separated upon the action of tin chloride on the solution of glycocoll in anhydrous acetic acid. The same complex compound was also obtained by the addition of two molecules CH_3COOH to the complex acid $\text{SnCl}_4 \cdot 2\text{NH}_2\text{CH}_2\text{COOH}$. The cryoscopic determinations of the molecular weight of the compound $\text{SnCl}_4 \cdot 2\text{NH}_2\text{CH}_2\text{COOH} \cdot 2\text{CH}_3\text{COOH}$, made in CH_3COOH , showed that the molecular weight determined constitutes $1/3$ of the formula molecular weight, and thus, that this compound dissociates into three ions. On the strength of these data, the mixed complex compound was assumed to appear as the product of an acid basic reaction of the complex acid $\text{SnCl}_4 \cdot 2\text{NH}_2\text{CH}_2\text{COOH}$ with CH_3COOH and the latter,

Card 1/3

On the Structure of the Complex Compound
 $\text{SnCl}_4 \cdot 2\text{CH}_3\text{COOH} \cdot 2\text{NH}_2\text{CH}_2\text{COOH}$

B001/B011

with its clear basic properties, to add on in the outer sphere (Ref. 1). Structure $[\text{SnCl}_4(\text{NH}_2\text{CH}_2\text{COO})_2]^{--} \cdot 2\text{CH}_3\text{COOH}_2^+$ was therefore ascribed to compound $\text{SnCl}_4 \cdot 2\text{NH}_2\text{CH}_2\text{COOH} \cdot 2\text{CH}_3\text{COOH}$. To obtain a confirmation of this assumption, the authors decided to investigate the ion transfer in the acetic acid solutions of compound $\text{SnCl}_4 \cdot 2\text{NH}_2\text{CH}_2\text{COOH} \cdot 2\text{CH}_3\text{COOH}$, by utilizing the labelled preparations $\text{NH}_2\text{CH}_2\text{C}^*\text{OOH}$ and $\text{CH}_3\text{C}^*\text{OOH}$. They expected that glycocoll, a component of the anion $[\text{SnCl}_4(\text{NH}_2\text{CH}_2\text{COO})_2]^{--}$, would move to the anode, and CH_3COOH to the cathode, on the action of electric current. It was found, however, that glycocoll, labelled with the isotope C¹⁴, moves to the cathode, i.e. it is a component of the cation; CH_3COOH labelled with the isotope C¹⁴ goes mostly over to the anode, and is therefore a component of the anion. The complex compound has therefore the structure: $[\text{SnCl}_4(\text{CH}_3\text{COO})_2]^{2-} (\text{NH}_3\text{CH}_2\text{COO})_2^+$. There are 1 table and 3 Soviet references.

TITLE: Raman spectra of systems formed by stannic chloride and esters. Part.3.

SOURCE: Optika i spektroskopiya, v.15, no.1, 1963, 48-51

TOPIC TAGS: Raman spectrum, stannic chloride, ester, methylbutyrate

ABSTRACT: In earlier studies the authors (Doklady AN SSSR, 137, 1357, 1961 and Optika i Spektroskopiya, 12, 359, 484, 1962) showed that the addition of stannic chloride to esters leads to weakening and eventual disappearance of the C=O stretching vibration band at 1735 cm^{-1} as the compound $\text{SnCl}_4 \cdot 2\text{ROOR}'$ is approached, and that at the same time there appears in the spectrum a band at about 1630 cm^{-1} associated with vibrations of the C=O band in the ester. Also, the band at 403 cm^{-1} , due to antisymmetric Sn-Cl vibrations, in the stannic chloride molecule shifts towards lower frequencies (to 340 cm^{-1}). In view of this it was deemed of interest to investigate the intensities of the 1630 , 1735 and 403 cm^{-1} lines for the purpose of evaluating the concentrations of the free components and products. Methyl butyrate was chosen for the study on the basis of preliminary experiments which showed that the given system is particularly suitable for such studies. The Raman spectra were recorded photographically by means of an ISP-51 spectrograph. The

Card 1/2

L 13096-63
ACCESSION NR: AP3003410

spectra were scanned on an MF-4 microdensitometer. The results for pure methyl butyrate and this ester with 50 mole percent stannic chloride are tabulated; they show that, as in the case of other esters, with addition of SnCl_4 the 1735 cm^{-1} band broadens and shifts to lower frequencies. The results of further measurements with stannic chloride concentrations from 0 to 100% are tabulated and presented in the form of a diagram. Calculations based on the experimental data show direct proportionality between the line intensities and the volume concentration. Thus, measurement of Raman line intensities provides a means for evaluating the equilibrium concentrations in $\text{SnCl}_4 +$ ester systems. Orig.art.has: 3 formulas, 3 figures and 2 tables.

TITLE: The influence of mechanical working on the magnetic properties of alloy AHKo4 (ANKo4)

PERIODICAL: Referativnyy zhurnal, Elektrotéhnika i energetika, no.19, 1962, 4, abstract 19B19. (Sb. tr. In-ta elektrotekhn. AN UkrSSR, 15, 1961, 122-124)

TEXT: Magnets of AHKo4 (ANKo4) of dimensions 24 x 24 x 16 mm were used in tests on the influence of grinding under two sets of conditions: (1) - normal (vertical feed 0.2 mm, horizontal 0.4 mm) and (2) severe (0.65 and 1.2 mm respectively without cutting fluid). The temperature the magnets reached was, in the first case, 70 - 80°C and, in the second, 200 - 250°C. The mean loss of weight on working was 30%. It was found that for the majority of the magnets, irrespective of the grinding conditions, H_{sat} increases on average by 6% and B_r by 5%. There is a particularly great increase in the specific magnetic energy. The influence of mechanical working on the magnetic properties is less the higher B_r and H_{sat} of the material. In particular, a magnet with Card 1/2

The influence of mechanical ...

S/196/62/000/019/003/004
E194/E455

$B_r = 11.2$ kilogauss and $H_{sat} = 510$ oersteds showed no appreciable change. It is supposed that additional forming of domains occurs during severe working. It is suggested that the improvement in magnetic properties may be due to structural changes caused by simultaneous heating and compression during grinding. ✓

TITLE: Selecting permanent-magnet materials for magnetic systems

SOURCE: Akademiya nauk Ukrayins'koyi RSR. Instytut elektrotehniki. Sbornik trudov, v. 18, 1961. Voprosy magnitnykh izmereniy, 45-52

TEXT: The author lists properties of Soviet permanent-magnet materials and shows how to undertake selection for a particular application. Composition, remanence B_r (in gauss), coercive force H_c (in oersted), specific magnetic energy $(BH/B^2)_{max}$ (in erg/cm³), and heat treatment during manufacture are tabulated for the following materials: (I) 'Al'ni' or AlNi (AN) alloys, consisting of Al, Ni and a few percent Cu; (II) 'Al'nisi' or AlNiSi (ANK) alloys, consisting of Al, Ni and Si; (III) - - - (ANK) alloys, containing Al, Ni and up to 12% Cu; (IV) 'Al'niko' or AlNiCo (ANKCo) alloys containing

X

Card 1/2

Selecting permanent-magnet ...

3/716/61/313/300/305/313
D207/D301

Ni, Al, Co, Cu and 0.15% Si; (V) 44.7% (AMKo3) alloy, consisting of Ni, Al, Co, Cu and Ti; (VI) a new high-coercivity alloy with $H_c = 1100$ Oe and $B_r = 8 \times 10^4$ G; (VII) foreign (non-Soviet) alloys Alnico-IV and Ticonal-2A. By way of example, selection of a suitable material for an electric measuring instrument is discussed. Considerations of magnetic properties and cost showed that for this purpose the alloy AMKo3 is best; its properties are $B_r = 9000$ G, $H_c = 650$ Oe, $(BH/\delta r^2)_{MAX} = 9.7 \times 10^4$ erg/cm³. There are 3 figures, 2 tables and 6 Soviet-block references.

TITLE: Distribution of the field intensity and the magnetic induction along a magnet in a closed magnetic circuit

SOURCE: Akademiya nauk Ukrayins'koyi RSR. Instytut elektrotehniki. Sbornik trudov, v. 18, 1961. Voprosy magnitnykh izmereniy, 78-85

TEXT: The authors measured the distribution of the magnetic field H and the magnetic induction B along a permanent magnet [Abstractor's note: material not specified] closed with a yoke of soft magnetic material. Two permanent magnets were tested; they were 35 and 100 mm long. At junctions between the ends of a permanent magnet and its yoke, an additional field H_a appeared because of discontinuity of magnetization at the junctions. The measured field H_m was a vector sum of H_a and an external applied field H_e . H_m varied con-

Card 1/2

Distribution of the ...

6/716/61/013/000/000/000
B207/B301

siderably along the magnets, being strongest at the magnet ends and weakest at the middle (in the neutral plane). This effect was stronger in the longer magnet and it decreased on increase of the magnetizing current. A similar but less marked effect was obtained for the measured magnetic induction: B_m was greater at the magnet ends. These variations of H_m and B_m along the magnet length were due to the additional field H_a which acted mainly at the magnet ends where it reinforced or opposed the external field. The authors recommend that measurements on permanent magnets closed by yokes be carried out in the middle parts of the magnets near or at the neutral plane. There are 6 figures and 3 references: 2 Soviet-bloc and 1 non-Soviet-bloc. The reference to the English-language publication reads as follows: R. L. Sanford and H. J. Bennet, An apparatus for magnetic testing at magnetizing forces up to 5000 oersteds, J. Res. NBS, v. 23 (Sept., 1939).

izmereniy, 119-121

TEXT: The authors describe an instrument for rejection of Permalloy samples, whose coercive force is too high. The quantity actually measured is the permeability: low permeability indicates that a sample has high coercive force and therefore it has to be rejected. Permeability μ is measured by means of a bridge circuit in which the unbalance current is almost linearly proportional to μ . Two adjacent arms of the bridge are coils with 10,000 turns of $16A$ (PEL) wire of 0.29 mm diameter; the two other arms are ohmic resistors. A standard Permalloy sample with known coercive force

TITLE: The effect of mechanical treatment on the magnetic properties of the μ -Fe₂Al₁₁ (AMKo4) alloy

SOURCE: Akademiya nauk Ukrayins'koyi RSR. Instytut elektrotehniki. Sbornik trudov, v. 18, 1961. Voprosy magnitnykh izmereniy, 122-124

TEXT: The effects of grinding on the magnetic properties of permanent magnets, made of the AMKo4 alloy are reported. Such magnets are used in electrical measuring instruments. The magnets were ground either (a) under the usual manufacturing conditions (heat evolved raised the sample temperature to 70 - 80°C) or (b) under extreme conditions of fast grinding without cooling (the temperature rose to 200 - 250°C). Grinding reduced the magnet weight by 30% and the cross-section by 20 - 25%. Hysteresis curves, obtained ballistically, usually indicated an increase of the coercive force, H_c , \checkmark

Card 1/2

The effect of mechanical ...

S/716/61/318/300/318/319
D207/D301

6%, and the remanence B_r by 5%. The specific energy ($BH/8\pi$) rose quite appreciably, even when H_c and B_r were not affected or when they decreased. This was because of change of the shape of hysteresis curves ('bulging'). Magnetic flux was reduced by 20 - 30% after grinding, in proportion to the change of the cross-section and of B_r . The effects of grinding were greater in the magnets with initially low H_c and B_r . The results for the grinding treatment (b) were similar to those obtained by the treatment (a): H_c and $(BH/8\pi)$ rose. There are 2 figures and 4 Soviet-bloc references.

TITLE: The influence of the switching speed on the error of the pulsed-induction method

SOURCE: AN UkrSSR. Povysheniye tochnosti i avtomatizatsiya izmeritel'nykh sistem
(Automating and increasing the accuracy of measuring systems). Klov, Naukova dumka,
1965, 44-47

TOPIC TAGS: magnetic field measurement, magnetic induction, switching circuit

ABSTRACT: During the determination of the characteristics of magnetically rigid materials by means of the pulsed induction method, the switching of the magnetization current is carried out by means of a knife switch or some contact system. This brief note presents the results of tests which show that the switching speed of the magnetization current, i.e., the time between the switching off and switching on of the knife switch, affects the magnitude of the ballistic galvanometer deflection and thus influences the error of the measurement. The author recommends the use of switching contacts. Orig. art. has: 5 formulas and 1 figure and 2 tables.

Rapid determination of silicon in cast irons and steels
Yu. I. Ustrenko, Zarydshaw, Lab. 4, 590-30 (USSR)
Rapid titration is made possible by coagulating SiO₂ with gelatin without evap'g the soln to dryness and igniting the residue. Further saving of time is effected by direct ignition of SiO₂ in an elec. furnace in a current of O.
The optimum procedure is based on studies of the influence of such factors as the concn. of the soln and gelatin and the boiling of the soln. before and after the addition of gelatin. Dissolve 1 g. cast Fe or 5 g. steel in 40-70 cc. of HCl without bringing it to boiling, add 10-15 cc. of 0.5% gelatin soln. (prepd. without boiling), stir well, dil. with hot H₂O and filter immediately. Wash the ppt. twice with acidulated H₂O and then with hot H₂O to a neutral reaction, dry it a little with filter paper and ignite in a current of O. Chas. Blam

Determination of p_{H} in natural waters. Yu. I. Ustenko and A. A. Volkashchik. *Zarodskaya Lab.*, 3, 435-8 (1936).—Previously a method was shown for calcg. p_{H} of waters on the basis of the bicarbonates and CO_2 in soln. by the equation: $p_{\text{H}} = 7.79 + \log (K/a)$, where K is bicarbonate hardness in German degrees, and a is dissolved CO_2 in mg./l. (*C. A.* 30, 2639). The calcd. values agree well with the exptl. data. The results differ by $\pm 0.08 p_{\text{H}}$ from the values obtained by the Michaelis colorimetric dets., and by $\pm 0.06 p_{\text{H}}$ from those by the electrometric dets. The p_{H} of natural waters is independent of the contents of salts of permanent hardness. With an increase of bicarbonates and a decrease of dissolved CO_2 p_{H} increases.

Rapid Determination of Calcium in Sinter Cakes. (In Russian.) Yu. I. Ugatenk^o and P. A. Bulakhova. Zarodskaya Laboratoriya (Factory Laboratory), v. 15, Mar. 1949, p. 382-383.

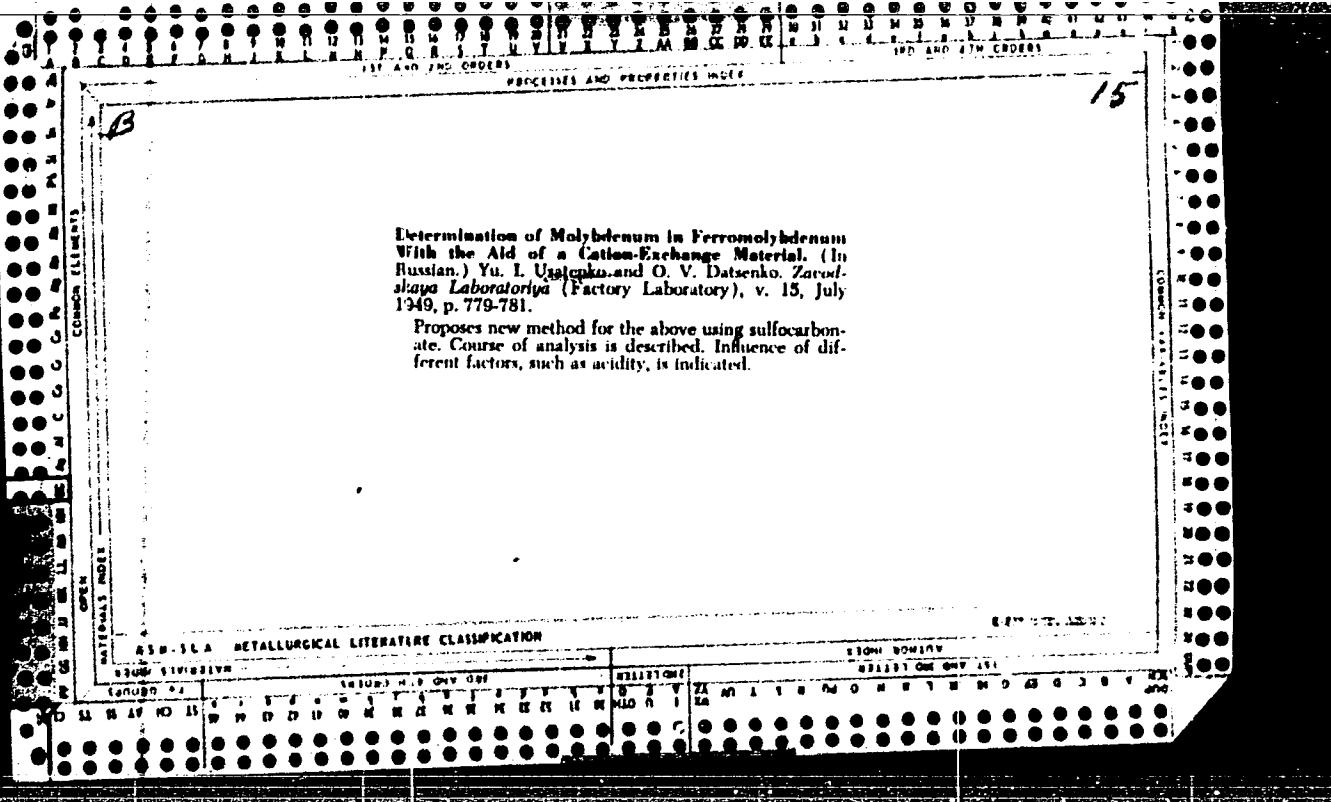

Describes procedure and reagents used. Time of determination is $\frac{1}{2}$ hour, said to be several times less than for commonly used methods.

CLASSIFICATION SHEET

Rapid Determination of Ferrous Oxide in Sinter. N. Z. Plotkin, Iu. I. Ustupko, and P. A. Bulakhova. (Zavodskaya Laboratoriya, 1948, vol. 15, Aug., pp. 900-1000). [In Russian]. The determination of ferrous oxide in sinter is carried out, in the method described, by finding the gain in weight of a finely ground sample after heating in a stream of air or oxygen at 110°C. Preliminary experiments show that under these conditions complete oxidation of Fe_2O_3 to Fe_3O_4 occurs during 5 min. By finding the weight of carbon dioxide formed during the oxidation, the determination of carbon in the sinter is simultaneously carried out. The results were found to agree well with those obtained by the normal volumetric method. It was found that fayalitic Fe_2O_3 remained unoxidized at lower temperatures, and it is suggested that such Fe_2O_3 can be determined by carrying out the oxidation at two temperatures.—*a. z.*

Accelerating the Analysis of Sinter. Iu. I. Uspensko and P. A. Bulakhova. (Zavodskaya Laboratoriya, 1948, vol. 18, No. 1, pp. 1128-1130). (In Russian). Details are given of rapid methods for the determination of silica, iron, and calcium in sinter; they are based on the fusion at 1000° C. of separate 0.3 g. portions of the finely powdered sample with 0.3 g. portions of anhydrous sodium carbonate to give products easily soluble in hydrochloric acid. For the determination of manganese, 0.1 g. of the finely powdered sample is dissolved by boiling in 10 ml. of a mixture of 70 ml. of phosphoric acid with 30 ml. of sulphuric acid. The satisfactory accuracy of these rapid methods was established in numerous tests with samples of sinter and standard samples of coke. a. g.

Analysis

Rapid Method for Determining Calcium and Magnesium in Dolomites, Magnesites, and Open-Hearth Slags. In: I. Ustyanterko and O. V. Datseiko. (Zavodskaya Laboratoriya, 1950, No. 1, 94-96). [In Russian]. A volumetric method is proposed for the determination of calcium and magnesium, the duration of the analysis being 1-5-2 hr. The method is based on the precipitation of the components being determined by standardized solutions of sodium oxalate and dibasic sodium phosphate, the excesses of which are then determined in an aliquot part of the filtrate by titration with permanganate and hydrochloric acid. For the acid titration, a mixed indicator with a very sharp colour change has been found. --S. K.

Determination of zirconium by amperometric titration
with an indicator. Ya. I. Usatenko and G. E. Beck-Sova
(Dzerzhinsk. Inst. Chern. Promst., Dnepropetrovsk,
Ukrain. Khim. Zhur, 20, 6(?)-2(1954) (in Russian). This
method is based on titration of Zr in NaZrF₄. Zr reacts
with P more intensely than does Fe. Near the equiv.
point Fe starts combining with P and this causes a change
in the diffusion current observed on a galvanometer. This
determin. must be carried out in an aqu.-alk. soln. nearly satu.
with NaCl at a pH of approx. 2.2 (slightly pink to methyl
orange). If, in the course of the detn. the pH changes, it
should be adjusted again. Al and Be must not be present.
SiO₂, Ca, Mg, Ti, Cr, and Fe⁺⁺ do not interfere.

Abstract: A number of solid-phase reactions have been investigated with a view toward achieving the solution of acid insoluble compounds. A 0.5 gms sample of iron ore agglomerate (A) was sintered with 0.3 gms Na_2CO_3 at 500-1,100°, in steps of 500°. The analysis of A was as follows (in percent): SiO_2 , 13.4; Fe^{3+} , 44.8; Fe^{2+} , 15.9; CaO , 1.08; Mn , 0.14; P , 0.023; S , 0.011. Maximum weight loss was observed for the mixture when sintering was carried out at 900-950°. At temperatures above 950° an insignificant increase in weight was

cupferron. I. Determination of titanium. Yu. I.
Ushatenko and G. E. Pekinskaya (Institute of Steel
Chemistry, Kiev) Zavod. zh. 1957, 21, 77.

1301-1302. Cupferron in various solvents in RCI or
NaCl, or in 0.1 to 3 N H_2SO_4 , etc., was used and defined
about 0.6 to 0.7 V (vs. the SCE) on a rotating
platinum micro-anode. The wave height is pro-
portional to the cupferron content. Titanium can be
titrated amperometrically at 0.8 V in a standard
cupferron solution prepared by heating 1 g of
cupferron in a crucible at 100°C for 1 hr. and
then dissolving it in 10 ml of 1 N H_2SO_4 . The
titration solution is prepared by dissolving
0.01 g of cupferron in 10 ml of 1 N H_2SO_4 and
an 0.01-molar solution of cupferron is obtained.

and heated in a split flame for 5 sec. 0.2 g
of Ti reacts with 2 mol. of cupferron. To
determine Ti in clays, etc., 0.1 g is heated at 100°C
with 0.4 g of Na_2CO_3 for a few min. The melt is
treated with water and HCl, the solution is neutral-
ized with aq. NH_4 salt, the ppt. is dissolved by the
addition of 1 or 2 drops of 5 N H_2SO_4 and sufficient
excess (about 1 ml) is added to make the solution
0.2 N. After the addition of 5 ml of 1 per cent
EDTA (odium salt) solution to form a complex
with the Ti, and 5 ml of NaOH, the solution is
heated at 100°C for 1 hr. and titrated.

TITLE: Determination of Titanium in Steels by the Method of Amperometric Cupferron Titration (Opredeleniye titana v stalyakh metodom amperometricheskogo titrovaniya kupferonom)

PERIODICAL: Tr. Nauchno-tekhn. o-va chernoy metallurgii. Ukr. resp. pravl., 1956, Vol 4, pp 39-43

ABSTRACT: A method is developed for amperometric titration of Ti with a solution of cupferron stabilized by phenacetin (cupferron remains stable for 3 months). It is established that 1 gram atom Ti reacts with 2 gram moles of cupferron. Fe salts impede the titration process by forming a stable complex with the cupferron. When determining the Ti in clays, fireclays, and Fe-Ti, the Fe is tied up with trilon B. In analyzing steels, the Ti is separated from the basic mass of Fe by minimum quantities of cupferron (Ti cupferronate precipitates first and is followed by the Fe cupferronate). In order to obtain a readily filterable precipitate, the precipitation should be carried out in the presence of a small amount of Fe^{3+} and any desired amount of Fe^{2+} . The

TITLE: Determination of Lead by the Method of Amperometric Titration
With an Indicator (Opredeleniye svintsa metodom amperometri-
cheskogo titrovaniya s primeneniem indikatora)

PERIODICAL: Tr. Nauchno-tekh. o-va chernoy metallurgii. Ukr. resp.
pravl., 1956, Vol 4, pp 44-48

ABSTRACT: A method was developed which permitted direct amperometric titration of Pb with an oxalate solution and with CuCl₂ as an indicator. Since the solubility product (SP) of PbC₂O₄ (2.74×10^{-11}) is considerably lower than the SP of CuC₂O₄ (2.87×10^{-8}), PbC₂O₄ will precipitate out first. Near the point of equivalence the indicator ions, Cu²⁺, will become attached, and the diffusion current previously occasioned by them will cease. A rotary Pt microelectrode serves as the indicator electrode in the titration process, while the comparison electrode is a mercury iodide semi-element (+0.017 v), which makes it possible to obtain a Cu wave without the superimposition of an external e.m.f. The current is measured by a galvanometer. The titration is
